1. For 4 to 20 mA input signal, a current input below 2 mA will disable the motor drive

2. Valves with a current command signal use a 0.1% tolerance shunt resistor to measure demand current.

3. For differing input and output signals, use two letters, e.g. AC denotes $\pm 10\text{ V}$ Input and 4 to 20 mA output

Electrical

Supply Voltage (Operational)	V	22 to 30
Supply Voltage (Absolute) ⁽¹⁾	V	-0.5 to 33
Current Consumption ⁽²⁾	A	0.8
Peak Current Draw ⁽³⁾	A	8

1. Conditions outside the absolute maximum ratings may cause permanent damage to the valve. These are absolute ratings only. Operation of the product outside of the nominal operating conditions is not guaranteed and may affect product reliability

2. Approximate current consumption for 100 Hz at 25 % amplitude

3. The valve supply must be protected with a 10 AT fuse or equivalent overcurrent protection device

Code 4 Power Off Position

C	Centre. The spool is intended to return to centre passively under typical flow conditions.

Valves can be provided with an enable function. This allows the valve to be enabled or disabled by varying the voltage into the enable pin. Note that valves with a code C command type can also be enabled or disabled using the command signal; see the corresponding table above for further details. Enable function is only applicable with Code E electrical connector option.
